

San Jose, Ca., July 21, 2009 - Ajaxo announced the completion of a two-year beta-test of its DOLFIN platform for Web applications. The DOLFIN platform was designed to provide an innovative way of managing business data down to the finest granularity. DOLFIN provides the ability to capture business transaction details in real-time; giving the enterprise a distinct strategic advantage over its competitors. Whereas traditional enterprise resource systems (ERP) focus on managing major business components, many day-to-day requirements are still managed using spreadsheets, email attachments, and hand written documents due to a lack of resources, time, or cost justification. DOLFIN delivers the “last mile” of information management to enterprises. The DOLFIN technology platform utilizes a user-friendly WEB browser interface to enable users with no IT background to create Web application on-demand. It also supports JAVA application development for the most demanding business applications.

Ajaxo will offer the DOLFIN technology to enterprises as a strategic tool. Unlike other products, DOLFIN is not available for everyone. Rather, DOLFIN is offered exclusively to one enterprise in each industry sector. It is Ajaxo’s goal to ensure that DOLFIN will deliver the highest impact and maximum benefit to its portfolio clients.
